

(a) Semantic and Feature Encoding

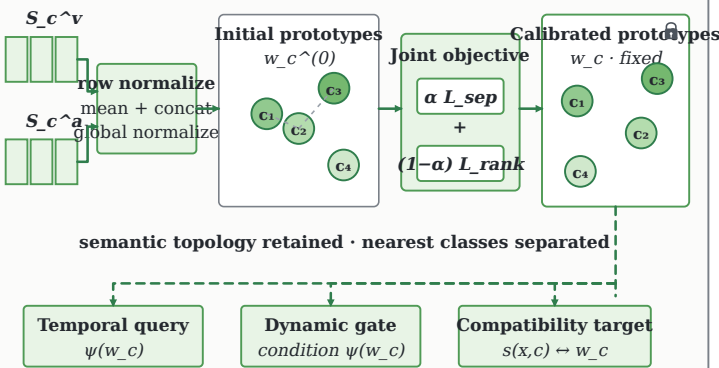

(b) Semantic-Guided Gaussian Temporal Grounding

(c) Decoupled Interaction, Fusion and Prediction

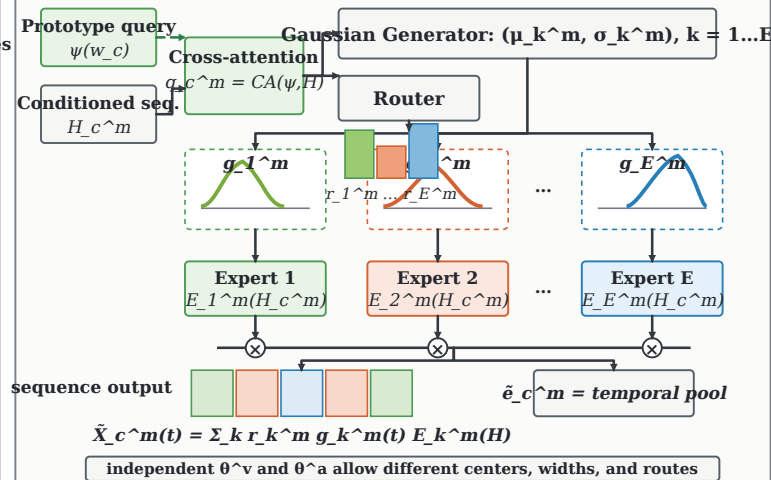

① DSPC · Discriminative Semantic Prototype Calibration

text-side optimization over $C_s \cup C_u$; no audio-visual samples

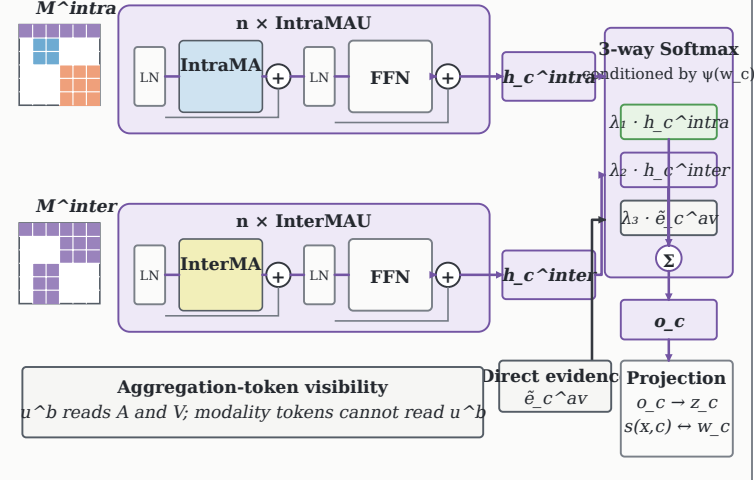

The prototype is optimized once, then frozen during main-network training.

② SGTG · Semantic-Guided Gaussian Temporal Grounding

the same structure runs independently for $m = v$ and $m = a$ 

③ DMIF · Decoupled Modality Interaction and Gated Fusion

two parameter-independent masked Transformer branches

→ tensor flow

--- class condition / query
